

EchoLens Video Analysis Report

General Information

Analyzed on: May 06, 2025 at 10:06 AM

Video Duration: 0.00 seconds

Analysis Results

Predicted Event: Fight

Confidence: 60.00%

Event Summary: The surveillance video initially misclassified as showing an explosion actually depicts a sequence of events in a dimly lit interior room. It begins with two individuals filming themselves, followed by a bright flash of light (possibly a firecracker being lit and thrown), creating a chaotic and blurry scene that could be misinterpreted as an explosion due to the resulting dust and movement of people. While some frames suggest potential injury or a fight, there's no definitive evidence of a large explosion. The overall event appears to be a small, contained incident, possibly involving a firecracker or other sudden combustion.

Detected Events

No significant events detected.
